WEB DEVELOPMENT CASE STUDIES

A visual report on three website interface concepts

This report describes the purpose, key interface elements, user experience choices, and possible improvements for three web development projects: a personal portfolio, an online learning platform, and an online food ordering website.

Prepared from the supplied website screenshots

Case Study 1: Personal Portfolio Website

1. Overview

The personal portfolio website introduces a student developer, presents their learning journey, and highlights skills and projects. Its main purpose is to create a professional online identity and make it easy for visitors to understand the developer's interests and contact them.

2. Objectives

- Present a concise introduction and internship availability.
- Show education, current learning goals, technical skills, and interests.
- Display selected projects with short descriptions and technology tags.
- Provide clear navigation and a prominent contact call-to-action.

3. Design and layout

The interface uses a light neutral background, dark typography, and green accents. Rounded cards, clear section headings, progress bars, and a simple top navigation make the page easy to scan. The hero section establishes the developer's identity first, followed by education, skills, projects, and contact information.

4. Main features

- Responsive-style navigation and hero section.
- Education and learning timeline.
- Skills and strengths presented in cards.
- Project summaries and contact button.

5. Suggested improvements

Add working links to each project, a downloadable résumé, a validated contact form, keyboard-focus indicators, and accessibility checks for contrast and image descriptions. Test the layout on mobile and desktop screens.

Case Study 3: Online Learning Platform Interface

1. Overview

The online learning platform interface helps learners discover courses, explore subject categories, and track progress. It represents a course marketplace and dashboard concept where users can compare beginner-friendly learning options and choose what to study next.

2. Objectives

- Make course discovery straightforward through search and categories.
- Present course level, duration, rating, instructor, and price at a glance.
- Encourage learners to continue studying through progress summaries.
- Offer clear actions for signing in, exploring courses, and enrolling.

3. Design and layout

The page combines a cool, pale background with purple and navy accents. A large hero area introduces the platform, while category tiles and course cards organize information into predictable groups. Small badges, ratings, course durations, and price labels help users compare options without opening every course.

4. Main features

- Course search and category navigation.
- Course cards with level, rating, duration, and price.
- Instructor details and enrollment buttons.
- Learning dashboard summary with goals and progress indicators.

5. Suggested improvements

Add functional search and filters, course detail pages, real enrollment and sign-in flows, and persistent progress tracking. Ensure buttons are keyboard-accessible and provide clear feedback when a learner enrolls or changes a course.

Case Study 8: Online Food Ordering Website

1. Overview

The online food ordering website presents a menu of food and drink items and lets visitors simulate adding products to a cart. Its goal is to make browsing appetizing, communicate prices and ratings clearly, and guide users from menu discovery toward checkout.

2. Objectives

- Show food items with names, descriptions, prices, and ratings.
- Help users browse menu categories such as mains, healthy food, desserts, and drinks.
- Make adding items to the cart easy and visible.
- Build trust through customer reviews, freshness messages, and a clear promotion.

3. Design and layout

The design uses a warm cream background with orange accents and pastel image panels to create a friendly food-focused identity. Product cards combine an illustration, a short description, rating, price, and add button. A promotional banner and customer testimonials provide additional context and encourage exploration.

4. Main features

- Search field, cart counter, and menu category filters.
- Product cards with prices, ratings, and add-to-cart controls.
- Promotion/coupon section and customer reviews.
- Responsive card grid intended for different screen sizes.

5. Suggested improvements

Connect the cart to a working order summary, quantity controls, and a checkout flow. Add dietary/allergen information, clear delivery charges and availability, and order confirmation feedback. Keep the demo clearly labelled if it does not process real orders.
